                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to antagonists and inhibitors of 24 bacterial genes and proteins. The proteins are thought to be essential for growth in several species of bacteria (including S. pneumoniae, B. burgdorferi, H. influenza and H. pylori). The proteins and coding sequences shown in the specification can be used to identify antagonists and inhibitors which can be used in disease treatment and pesticides. In particular, they can be used against M. tuberculosis. The present sequence is one of the genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying antibacterial compounds, comprises identifying an antagonist or inhibitor of the expression of a gene encoding polypeptide essential for bacterial growth or survival claim 1; Fig 1; 75pp; English.

                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC growth or survival. gcpE is 1 of 22 E. coll genes (see CC AAA88692-713) identified as being essential (there is no deletion CC genotype). These 22 genes fulfil criteria for being attractive CC antibacterial targets: hypothetical open reading frames coding for CC essential functions (mutation is lethal for growth in rich media); CC broad conservation (orthologues are present in a wide range of compared conservation (orthologues are present in a wide range of compared conservation (orthologues are present in a wide range of compared conservation (orthologues are present in a wide range of compared conservation (orthologues are present in a wide range of compared conservation (orthologues are present in a wide range of compared conservation constitution of low toxicity compared to incompared constitution of the compared conservation of an essential gene or of its function provides the key contacting a bacterial therapy. The invention provides methods for contacting a bacterial cell comprising an essential gene with a conditate antagonist or inhibitor, and testing whether contact leads to cell growth inhibition and/or cell death. The method allows the conservation of the analysis of surrogate markers.

                                                                                                                                                                                                                                                                                                                                                      δ.
                                                                                                                                                                                                                                                                                                                                                                             US-09-921-992-78 (1-372) \times AAC82653
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes almovel method for incorporating gcpE and yfgB cg genes into viruses and cells for increasing isoprenoid content and identifying e.g. antimicrobial agents, comprises using DNA sequences (1) cfrom the gcpE or yfgB genes of bacteria or parasites or DNA sequences (2) cill which hybridize to the specified genes or encode a plastid protein cwith the same biological activity as those encoded by the genes. The invention also describes (1) plant cells containing (1) or (11); (2) plant cells containing (1) or (11); (2) created containing the enzymatic activity of a cgpE protein; or (4) screening compounds (A) that have antimycotic, antiparasitic, fungicidal or herbicidal activity in humans or animals or antiviral containing the enzymatic activity in plants. (1) and (11) care used: (1) to increase (the isoprenoid levels in viruses and cells; cotential antibacterial, antimycotic, antiparasitic, or antiviral agents or antiviral agents or antiviral agents or animals or antiviral agents or or animals or antiviral agents or or animals or antiviral agents or or animals or animals; or animals, or antiparasitic, fungicidal cor herbicidal agents for agriculture.

The CC expression of GCPE protein in organisms increases the level of CC tocopherol substrate such as isopentyl diphosphate and dimethylallyl CC diphosphate biosynthesis. Transgenic organisms overexpressing GCPE protein can nutritionally enhance food and feed sources. Overexpression CC e.g., oxidative stress tolerance such as to oxygen or ozone, UV CC tolerance, etc. gcpE may be used to obtain nucleic acid molecules from CC used as or primers. The recombinant vectors are used in plant CC transformation or transfection. gcpE an also act as markers capable of detecting polymorphisms such as single nucleotide polymorphisms (SNPs). CC gcpE is also used to determine the level or pattern of expression of the protein. The present sequence is Escherichia coli gcpE gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gcpE nucleic acid which is an essential gene of the methyl-D-erythritol
phosphate pathway, encoding a fully defined GCPE protein which is
useful for increasing levels of tocopherol substrates in plants .

                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the complete genome sequence of the bacterium Haemophilus influenzae strain Rd. The invention relates to a computer readable medium (CRM) having recorded upon it the complete H.influenzae sequence (I), a representative fragment of (I) or a nucleotide sequence at least 99% identical to (I). By providing the full-length genomic sequence in a computer readable form, it is possible to identify commercially important nucleic acid fragments and expression modulating fragments (EMFs) of the Haemophilus genome. The EMFs can be used to regulate the expression of a nucleic acid molecule. Vectors and altered organisms comprising the predicted ORFS can be used to produce any of the polypeptide fragments of the H. influenzae Rd genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (HUMA-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a gene (I) derived from Buchnera sp. CC containing the DNA (a) or (b), (a) has a fully defined base pair CC sequence selected from a table of sequences found in the Buchnera sp. CC genomic DNA of ABA92787 given in the specification or is a DNA selected CC from complementary DNA sequences, and (b) is a DNA which hybridises with CC the DNA (a) and encodes a protein. Also described are: (I) a recombinant CC vector (II) containing (I); (2) a transformant (III) containing (I); (3) a genomic DNA of Buchnera sp. containing the sequence given in CC ABA92787; (4) a plasmid derived from Buchnera sp. containing DNA (c) or CC (d), (c) is a DNA containing a fully defined sequence given in ABA92788 CC method for the preparation of a protein in which (III) is cultured and CC the expression protein of the objective protein is collected from the CC resultant culture. The DNA is useful for developing agricultural CC chemicals for exterminating cockroaches. The present sequence represents the specifically claimed Buchnera sp. genomic DNA sequence, from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       망
The present invention relates to nucleic acid sequences (ABQ67188-ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ABQ67966;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                        The present invention relates to nucleic acid sequences (ABG67188-ABG71212) from Listeria sp. The sequences are useful as prand primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can used to screen for compounds that modulate gene expression, replicat and pathogenicity of Listeria (potential therapeutic agents), also fureating infections by Listeria, and are useful as immunogens in
                                                                                                                                                                Sequence 1107
                                                                                                                                                                                                                      Note: The sequence data for this patent did not form of the printed specification, but was obtained in ele

                                                                                                                                                                                        The present sequence is the genome sequence of Listeria monocytogenes EGD-e. This sequence and fragments of this sequence are useful for selecting probes and primers for detecting genes in L. monocytogenes are related organisms, and to study genetic polymorphisms and other genome proteins (ABB47297-ABB50149) expressed from the present sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. This sequence proteins encoded by it are also useful for selecting compounds that

                                                                                                                                                    of the printed specification, directly from WIPO at ftp.wip.
                                                                                                                                                                                      The present invention relates to nucleic acid sequences (ABQ67188-ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines.
                                                                                                                                                                                                                                                                                                                      Claim 14;
                                                                                                                                                          inti-Listeria vaccines.

cc The invention describes a method of monitoring differential expression of cc genes in a first Bacillus cell relative to expression of the genes in cother Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus cells to a substrate containing array of Bacillus cells relative gene expression by an observed hybridisation reporter signal of cc relative gene expression by an observed hybridisation reporter signal of cc genes in a first Bacillus cell relative to expression of the same genes cc in one or more second Bacillus cells. The method is useful for monitoring close everal genes from a Bacillus cell, discovering new cc genes, identifying possible functions of unknown open reading frames and contitoring gene copy number variation and stability. Monitoring changes cc in expression of genes may be used to provide a representation of the way contitoring changes in culture conditions, cells adapt to changes in culture conditions.

Cc environmental stress or other physiological provocation. Extensive contitoring changes are suppressed to the provide a representation of the same copy number variation and stability. Monitoring changes compared to the provide a representation of the way continue to the physiological provocation. Extensive continues are continued to the provide and array continued to the provide and the provide and array continued to the provide and the

Claim 1; SEQ ID 1; 80pp; English.

The present invention describes a polynucleotide (I) comprising a CC sequence of a Bifidobacterium genome selected from the nucleotide CC sequences given in AB081842 and AB081843, or a sequence exhibiting at CC least 90% identity or which hybridises with the sequences given in CC AB081842 and AB081843. Also described is a polynucleotide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in AB081843. Also described is a polynucleotide (II) encoding cC given in AB081843. Also described is a polynucleotide (II) encoding a heterologous polypeptide. (I) has antidiarrheic and cencoding a heterologous polypeptide. (I) has antidiarrheic and composition of Bifidobacterium longum in a biological sample. A carrier containing cC (I) (which is a probe) is useful for the detection and/or identification cf Bifidobacterium longum in a biological sample. A carrier containing cc pathogenic bacteria and/or treating diarrhea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition containing N.B. The sequence data for specification but is based European Patent Office. this patent on sequence is not represented in the printed information supplied by the

Sequence B₽; 72540 Α, 102738 C; 103221 G; 71481 Ţ, 0

The sequences are useful as probe and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (INSP )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           anti-Listeria vaccines.
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic for the printed specification int/pub/published_pct_sequences directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 14; SEQ ID 1137; 180pp;

It was isolated from Helicobacter pylori and encodes a H.pylori GHPO protein. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for
